Total	4050.66	12.04	12.03

Average of Education_Years and Average of Savings_Rate by ID and Employment_Sector

DATA INSIGHTS

The Schooling Paradox: Here is the biggest shock in the data: agricultural workers actually spend the *most* years in formal schooling, yet they make the least money. Meanwhile, Services workers have fewer years of classroom education but walk away with much higher pay and savings.

Experience Beats a Degree: This gap proves that racking up years in a classroom doesn't guarantee wealth. In hands-on sectors like Industry and Services, practical on-the-job experience and specialized technical skills pay a far higher premium than a general degree.

Higher Pay Means Better Savings: The data shows a perfect chain reaction: as wages drop from Industry down to Agriculture, savings rates drop right along with them. When people make more, they don't just blow the extra cash, they actually save a bigger slice of their paychecks.
